

2. Methodology

The data used in this study are JCI data, inflation rate, BI rate, exchange rate, and stock prices of Bank BCA, Bank Bukopin, Bank BRI, and Bank Danamon. In this study, researchers used the help of computer software. The sample withdrawal criteria used by researchers are: 1) Banks found on the Indonesia Stock Exchange (IDX) during the July 2010 period s.d. June 2016. 2) Commercial banks that are well known to the public.

2.1 Regression Analysis

Regression analysis is a method of analysis that aims to show the mathematical relationship between the response variables with explanatory variables (Rawlings et al., 1998). The variables in regression analysis are usually called the independent variable (x) and the dependent variable (y).

The general equation model for multiple linear regression is as follows:

$$Y_i = \beta_0 + \beta_1 X_{1i} + \beta_2 X_{2i} + \dots + \beta_n X_{ni} + \varepsilon_i \quad (1)$$

Equation (1) is then estimated to be

$$\hat{Y} = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \dots + \beta_n X_n, \quad (2)$$

where \hat{Y} : estimates from Y_i , β_0 : intercept, β_i : slope for the independent variable X_i , which shows the influence of the independent variable X_i on the dependent variable \hat{Y} ($i = 1, 2, 3, \dots$).

The Ordinary Least Square (OLS) method is used to predict the regression coefficient by minimizing the number of error squares $\sum_{i=0}^n \varepsilon_i^2$

The OLS method estimator is

$$J = \sum_{i=0}^n \varepsilon_i^2 = \sum_{i=0}^n (y_i - \hat{y})^2, \quad (3)$$

where $\sum_{i=0}^n \varepsilon_i^2$ is the number of error squares.

2.2 Model Testing

In this study, the model that has been obtained from the Ordinary Least Square (OLS) estimation will be tested with the classic assumption test and the Goodness of Fit test. The classic assumption test consists of a normality test, an autokoleration test, a multicollinearity test, and a heteroscedasticity test. If the classical assumption test is met, the effect of the independent variable on the dependent variable will be seen using the Goodness of Fit test, which consists of the F test, t test and R^2 test. The F test aims to determine the relationship between independent variables and independent variables. In the F test, there is a value of Number of Squares (JK) which is consists of the Total Square ($JK(T)$), Number of Regression Squares ($JK(R)$), and the Remaining Square ($JK(S)$) (Rawlings et al., 1998). The general formula is

$$JK(S) = \sum_{i=0}^n (y_i - \bar{y})^2; \quad (4)$$

$$JK(R) = \sum_{i=0}^n (\hat{y} - \bar{y})^2; \quad (5)$$

$$JK(S) = \sum_{i=0}^n (y_i - \bar{y})^2. \quad (6)$$

$JK(R)$ has degrees of freedom (df) of k and $JK(S)$ of $(n - k - 1)$. Thus, the F test formula is

$$F = \frac{JK(R)/k}{JK(S)/(n-k-1)} \quad (7)$$

T test shows the influence of one independent variable individually in explaining the variation of the independent variable (Draper and Smith, 1981). The *t* test formula is

$$t_{hitung} = \frac{\beta_i}{Se(\beta_i)} \quad (8)$$

dengan *Standard Error* koefisien *se_i* adalah

$$Se(\beta_i) = \sqrt{\frac{\sum_{i=1}^n (Y_i - \hat{Y}_i)^2}{n - k - 1} \cdot \frac{1}{\sum_{i=1}^n (X_i - \bar{X}_i)^2}} \quad (9)$$

The coefficient of determination (R^2) measures the ability of the model to explain the variation of independent variables. The coefficient of determination is between zero and one. If the value is close to zero, then the ability of the independent variable in explaining the bound variable is limited. If the value approaches one, the ability of the independent variable in explaining the dependent variable is almost perfect (Rawlings, 1998). Equation R^2 is

$$R = \sqrt{\frac{\sum_{i=1}^n (\hat{y}_i - \bar{y}_i)^2}{\sum_{i=1}^n (y_i - \bar{y}_i)^2}} \quad (10)$$

\hat{y} is the estimated value of the regression model, \bar{y} is the average value of y, y_i is the value of y, $JK (R)$ is the sum of the square of the regression, and $JK (T)$ is the sum of the total squares. To determine partial correlation

$$r_{y,x_i} = \frac{n \sum_{i=1}^n x_i y_i - \sum_{i=1}^n x_i \sum_{i=1}^n y_i}{\sqrt{\left(n \left(\sum_{i=1}^n x_i^2 \right) - \left(\sum_{i=1}^n x_i \right)^2 \right) \left(n \left(\sum_{i=1}^n y_i^2 \right) - \left(\sum_{i=1}^n y_i \right)^2 \right)}} \quad (11)$$

3. Results and Discussion

The research data used in this study are the Composite Stock Price Index (CSPI), inflation rate, BI Rate, exchange rate, share prices of Bank BCA, Bank Bukopin, Bank BRI, and Bank Danamon taken from July 2010 - June 2016.

Table 1. Estimation Result of Model Parameters for the influence of CSPI, inflation rate, BI rate, and exchange rate on Bank BCA stock prices using Ordinary Least Square

Parameters	$(X'X)^{-1}X'Y$
$_0 \beta$	-8039.00191
$_1 \beta$	2.2810671
$_2 \beta$	-13525.4279
$_3 \beta$	12698.0565
$_4 \beta$	0.73472562

Table 2. Estimation Result of Model Parameters for the influence of CSPI, inflation rate, BI rate, and exchange rate on Bank Bukopin's stock prices using Ordinary Least Square

Parameters	$(X'X)^{-1}X'Y$
$_0 \beta$	383.3952
$_1 \beta$	0.115999
$_2 \beta$	-119.424
$_3 \beta$	2398.532
$_4 \beta$	-0.03514

Based on Table 1, the BCA Bank model is obtained as follows:

$$Y = -8039 + 2.28X_1 - 13525.43X_2 + 12698.06X_3 + 0.73X_4.$$

Based on Table 2, the Bank Bukopin model is obtained as follows:

$$Y = 383.39 + 0.11X_1 - 119.42X_2 + 2398.53X_3 - 0.03X_4.$$

Where X_1 : Composite Stock Price Index (CSPI), X_2 : inflation rate, X_3 : BI Rate, and X_4 : exchange rate.

Table 3 Estimation Result of Model Parameters for IHSG influence, inflation rate, BI rate, and exchange rate of the BRI Bank's share price using Ordinary Least Square

Parameters	$(X'X)^{-1}X'Y$
β_0	-9390.0445
β_1	2,55237432
β_2	-29192.902
β_3	67861.3711
β_4	0.33926498

Tabel 4 Estimasi Result Parameter Model pengaruh IHSG, tingkat inflasi, BI rate, dan nilai tukar terhadap harga saham Bank Danamon menggunakan *Ordinary Least Square*

Parameters	$(X'X)^{-1}X'Y$
β_0	9913.921202
β_1	0.499005895
β_2	17329.20177
β_3	-56828.0044
β_4	-0.41236889

Berdasarkan Tabel 3, diperoleh model Bank BRI sebagai berikut :

$$Y = -9390.04 + 2.55X_1 - 29192.90X_2 + 67861.37X_3 + 0.34X_4$$

Berdasarkan Tabel 4, diperoleh model Bank Danamon sebagai berikut :

$$Y = 9913.92 + 0.49X_1 + 17329.20X_2 - 56828X_3 - 0.41X_4$$

Where X_1 : Composite Stock Price Index (CSPI), X_2 : inflation rate, X_3 : BI Rate, and X_4 : exchange rate.

The classic assumption test for normality has been fulfilled, namely normally distributed data, no autocorrelation, no multicollinearity, and does not contain heteroscedasticity. Then the Goodness of Fit test will be conducted to determine the effect of independent variables with the dependent variable.

For BCA Bank, $F_{hitung} = 349.4584405$. With $n = 72$, $k = 4$, we get $n_1 = 4$ and $n_2 = n - k - 1 = 72 - 4 - 1 = 67$, so $F_{tabel} = 2.51$. Because $F_{hitung} > F_{tabel}$, then ditolak H_0 is rejected and H_1 is accepted, so there is an influence between the independent variables (X_1, X_2, X_3, X_4) and the dependent variable (Y). If t_{hitung} for $X_1 = 19.63805622$, $X_2 = -3.741475975$, $X_3 = 2.286652836$, and $X_4 = 19.54671465$, with $\alpha = 0.05$ and $n - k - 1 = 72 - 4 - 1 = 67$, obtained $t_{tabel} = 1.99601$, then conclusion: $t_{hitung} > t_{tabel}$ then H_0 is rejected and H_1 is accepted so X_1, X_3 , and X_4 have a significant effect on the dependent variable (Y). If $t_{hitung} < -t_{tabel}$ then H_0 is rejected and H_1 is accepted so X_2 has a significant effect on the dependent variable (Y). The R-squared value of BCA Bank is 0.960671 or 96%, so the independent variable influences the dependent variable by 96% and the rest is influenced by other variables. While partial correlation between each independent variable and the dependent variable are: $r_{X_1Y} = 0.896401035$, $r_{X_2Y} = 0.070380379$, $r_{X_3Y} = 0.60073313$ $r_{X_4Y} = 0.900764507$.

For Bank Bukopin, $F_{hitung} = 1494.586803$. With $n = 72$, $k = 4$, we get $n_1 = 4$ and $n_2 = n - k - 1 = 72 - 4 - 1 = 67$, so $F_{tabel} = 2.51$. Because $F_{hitung} > F_{tabel}$, then ditolak H_0 is rejected and H_1 is accepted, so there is an influence between the independent variables (X_1, X_2, X_3, X_4) and the dependent variable (Y). t_{hitung} for $X_1 = 8.541635751$, $X_2 = -0.3338249286$, $X_3 = 2.092591206$, and $X_4 = -8.980887086$, with $\alpha = 0.05$ and $n - k - 1 = 72 - 4 - 1 = 67$, obtained $t_{tabel} = 1.99601$. Conclusion: $t_{hitung} > t_{tabel}$ then H_0 is rejected and H_1 is accepted so X_1 and X_3 have a significant effect on the dependent variable (Y). If $t_{hitung} < -t_{tabel}$ then H_0 is rejected and H_1 is accepted so that X_2 and X_4 have a significant effect on the dependent variable (Y). R-squared value of Bank Bukopin is 0.393293 or 39%, so the independent variable influences the dependent variable by 39% and the rest is influenced by other variables. While the partial correlation between each independent variable and the dependent variable is: $r_{X_1Y} = 0.367446579$, $r_{X_2Y} = -0.002469391$, $r_{X_3Y} = -0.024736509$, $r_{X_4Y} = -0.093247664$.

For BRI bank, $F_{hitung} = 353.615271$. With $n = 72$, $k = 4$, obtained $n_1 = 4$ and $n_2 = n - k - 1 = 72 - 4 - 1 = 67$, so $F_{tabel} = 2.51$. Because $F_{hitung} > F_{tabel}$, then ditolak H_0 is rejected and H_1 is accepted, so there is an influence between the independent variables (X_1, X_2, X_3, X_4) and the dependent variable (Y). If t_{hitung} for $X_1 = 23.52736585$, $X_2 = -6.362485721$, $X_3 = 6.235084644$, and $X_4 = 13.04139769$, with $\alpha = 0.05$ and $n - k - 1 = 72 - 4 - 1 = 67$, obtained $t_{tabel} = 1.99601$. Conclusion: $t_{hitung} > t_{tabel}$ then H_0 is rejected and H_1 is accepted so X_1, X_3 and X_4 have a significant effect on the dependent variable (Y). If $t_{hitung} < -t_{tabel}$ then H_0 is rejected and H_1 is accepted so X_2 has a significant effect on the dependent variable (Y). R-squared value of BRI Bank is 0.921177 or 92%, so the independent variable influences the dependent variable by 92% and the rest is influenced by other variables. While partial correlation

between each independent variable and the dependent variable are: $r_{X_1Y} = 0.921489262$, $r_{X_2Y} = 0.012786911$, $r_{X_3Y} = 0.593880254$, $r_{X_4Y} = 0.846180655$.

For Bank Danamon, $F_{hitung} = 43.8628305$. With $n = 72$, $k = 4$, we get $n_1 = 4$ and $n_2 = n - k - 1 = 72 - 4 - 1 = 67$, so $F_{tabel} = 2.51$. Because $F_{hitung} > F_{tabel}$, then H_0 is rejected and H_1 is accepted, so there is an influence between the independent variables (X_1, X_2, X_3, X_4) and the dependent variable (Y). If t_{hitung} for $X_1 = 4.392063897$, $X_2 = 4.898342498$, $X_3 = -6,343388717$, and $X_4 = -11,30920312$, with $\alpha = 0.05$ and $n - k - 1 = 72 - 4 - 1 = 67$, obtained $t_{table} = 1.99601$.

If $t_{hitung} > t_{tabel}$ then H_0 is rejected and H_1 is accepted so X_1 and X_2 have a significant effect on the dependent variable (Y). If $t_{hitung} < -t_{tabel}$ then H_0 is rejected and H_1 is accepted so X_3 and X_4 have a significant effect on the dependent variable (Y). R -squared value of Bank Danamon is 0.739150 or 73%, so the independent variable influences the dependent variable by 73% and the rest is influenced by other variables. While the partial correlation between each independent variable and the dependent variable is:

$$r_{X_1Y} = -0,38999695, r_{X_2Y} = -0.05244681, r_{X_3Y} = -0.669001679, r_{X_4Y} = -0,78433493.$$

Table 5. Simpulan nilai parameter pengaruh IHSG, tingkat inflasi, BI rate, dan nilai tukar terhadap harga saham berdasarkan uji Ordinary Least Square (OLS)

Parameter	β_0	β_1	β_2	β_3	β_4
Harga Saham					
Bank BCA	-8039.00191	2.2810671	-13525.4279	12698.0565	0.73472562
Bank Bukopin	383.3952	0.115999	-119.424	2398.532	-0.03514
Bank BRI	-9390.0445	2.55237432	-29192.902	67861.3711	0.33926498
Bank Danamon	9913.921202	0.499005895	17329.20177	-56828.0044	-0.41236889

4. Conclusions

Based on the calculation of Ordinary Least Square (OLS), the value β (parameter) is obtained from the estimation of the JCI influence model, inflation rate, BI rate, and exchange rate on the stock prices of Bank BCA, Bank Bukopin, Bank BRI, and Bank Danamon which are listed in the Table 4.17. Based on the significance test, the effect of the CSPI (X_1), the inflation rate (X_2), the BI Rate (X_3), and the exchange rate (X_4) on stock prices (Y) have a significant effect. However, the effect obtained from the partial correlation test (r) is a positive effect for Bank BCA and Bank BRI and negative for Bank Bukopin and Bank Danamon.

Biography / Biographies

Riaman is a teaching staff in the mathematics study program at the Mathematics Department of the University of Pajajaran since 1997. The mathematics degree was won from the Mathematics Department of the University of Padjadjaran in 1995, while the Masters of Actuarial Science was obtained from the Bandung Institute of Technology in 2000. The field of research currently being undertaken is the field of applied mathematics. More specifically are: fields of financial mathematics, actuarial mathematics, survival models, mathematical statistics, and reliability. Since 2001 until now he has joined as a member of IndoMS, and since 2017 joined IAENG.

Sukono is a lecturer in the Department of Mathematics, Faculty of Mathematics and Natural Sciences, Universitas Padjadjaran. Currently serves as Head of Master's Program in Mathematics, the field of applied mathematics, with a field of concentration of financial mathematics and actuarial sciences.

Abdul Talib Bon is a professor of Production and Operations Management in the Faculty of Technology Management and Business at the Universiti Tun Hussein Onn Malaysia since 1999. He has a PhD in Computer Science, which he obtained from the Universite de La Rochelle, France in the year 2008. His doctoral thesis was on topic Process Quality Improvement on Beltline Moulding Manufacturing. He studied Business Administration in the Universiti Kebangsaan Malaysia for which he was awarded the MBA in the year 1998. He's bachelor degree and diploma in Mechanical Engineering which his obtained from the Universiti Teknologi Malaysia. He received his postgraduate certificate in Mechatronics and Robotics from Carlisle, United Kingdom in 1997. He had published more 150 International Proceedings and International Journals and 8 books. He is a member of MSORSM, IIF, IEOM, IIE, INFORMS, TAM and MIM.
